October 1957

### MORE DAIRY HERDS SHOULD BE INCLUDED IN THE NATIONAL COOPERATIVE DAIRY HERD IMPROVEMENT PROGRAM

A half century of DHIA recordkeeping has shown that dairymen who keep records on their herds -- (1) Improve the production level of their herds; (2) Feed their cows more efficiently; (3) Lower their costs of milk production, and (4) Increase their net returns.

At present a relatively small percentage of the dairymen are availing themselves of the opportunity of becoming more efficient dairymen by getting production records on their cows and herds. Less than 10 percent of the dairy cows of the nation are now in a recordkeeping program.

On page 2 is a table showing the number of commercial dairy farms by size of herd, by States (based on the 1954 Agricultural Census) and the number of herds and cows enrolled in the National Cooperative Dairy Herd Improvement Program. This table shows there is a surprising number of herds, both large and small, not now enrolled in the recordkeeping program. Owners of these herds should be interested in some plan of obtaining production records on their cows and herds. Every dairyman should be given an opportunity to enroll his herd in one of the nationally recognized recordkeeping plans of the National Cooperative Dairy Herd Improvement Program.

The National Cooperative Dairy Herd Improvement Program includes a plan of recordkeeping that fits the needs and pocketbook of any dairyman regardless of size of herd, level of production, and whether registered or grade.

The 3 plans of recordkeeping available to the dairymen are:

1. Standard DHIA
2. Owner-Sampler
3. Weigh-A-Day-A-Month

With production records the poorest herd can be improved and the production of the best herd can be maintained or increased. Without production records the dairyman can only guess how to cull, feed, and breed to improve the producing efficiency of his herd.

Number and percentage of farms and milk cows in the United States, by size of herd, and number of herds and cows included in the National Cooperative Dairy Herd Improvement Program, by regions and States. 1/

Region and State	Size of herd										DHIA, OS and WADAM

2/ Number of herds and cows included in National Cooperative Dairy Herd Improvement Program, January 1, 1957.

## DHIA PROVED-SIRE RECORDS TABULATED IN SEPTEMBER 1957

Following is a list of 541 sires whose records were tabulated or retabulated by the Dairy Husbandry Research Branch in September 1957. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., \*12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., \*May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
